For best overall performance, use with Buffalo Technology Nfiniti wireless clients. Once you've connected to the internet through the router, you may switch to a wireless connection if desired. The computer used to configure the AirStation should be set to obtain an IP address automatically using a DHCP server this is the default. Naturally, if you change your AirStation's IP address, you'll have to enter the new address instead. A window will open, prompting you to enter a User ID and Password. If your ISP assigns IPs automatically most cable providers do, their DHCP server will give your router an IP address. If additional login information is required to connect to the internet, the wizard will ask for it. Enter any required login information if asked. Contact your DSL provider for any For more information on AOSS, see pages 14 and 15. Consult your wireless clients' manuals for instructions on configuring them manually. You can get SSID and encryption information from the AirStation's initial setup screen, as shown above. By default, encryption is not enabled "open". If you prefer to use eFrom here, you can rerun the Internet Connection Wizards, change your wireless SSID and channel, and choose your encryption type under Basic Settings. The Wireless section shows your SSID and encryption settings. You can also configure port forwarding for your internet games, configure your UPnP settings, update your AirStation's firmware To navigate settings, choose a category at the top of the page and then a submenu below. Settings will appear on the left, help files on the right. Click Initialize Now to restore your AirStation to factory defaults and restart it. The blue AOSS button at the top left of the page has the same function as the physical AOSS button on the top of the router it initiates the AOSS process. If all your clients support AOSS, it's very simple to set them up.

Press the AOSS button on the router, or the one on this page, and then push the AOSS button on the client device. Each client device will have to be set up separately. If your router and your client device are installed and both support AOSS, then making a secure wireless connection between them is very easy. Push the AOSS button on the top of your router and hold it in for a few seconds. The AOSS light will begin to flash amber. You now have two minutes to push the AOSS button on your client device and finish the connection. An AOSOFF Mode The default Any one within range can easily connect to your wireless network. This might not be what you want. Buffalo recommends enabling encryption on a Wireless Router.
